

Situation 38: Irrational Length

Prepared at Penn State

Mid-Atlantic Center for Mathematics Teaching and Learning
Date last revised: July 16, 2005 – Started by: Jeanne Shimizu

Prompt

A secondary pre-service teacher was given the following task to do during an interview:

Given: square ABCD.

Construct a square whose area is half the area of square ABCD.

(Note: The pre-service teacher was not given a drawing or any dimensions for ABCD.)

The student chose the dimensions of ABCD to be 1 unit by 1 unit and approached the problem in two ways.

Method 1: Reasoning with a figure

She divided ABCD into smaller squares as shown in Figure 1a and noted each small square has area $\frac{1}{4}$. Sketching a new square as in Figure 1b, she claimed a $\frac{3}{4} \times \frac{3}{4}$ square has area $\frac{9}{16}$. She concluded that the square she wants (sketched in Figure 1c) has a side length somewhere between one-half and three-fourths.

$$\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$$

(a)

$$\frac{3}{4} \times \frac{3}{4} = \frac{9}{16}$$

(b)

$$? \times ? = \frac{1}{2}$$

(c)

Figure 1.

Method 2: Reasoning from a formula

Assuming implicitly that the area of given square ABCD is 1 square unit, she noted that the desired area of the new square is one-half square unit. Using a formula for the area of a square, she produced $s^2 = \frac{1}{2}$ and then

$$s = \sqrt{\frac{1}{2}} = \frac{1}{\sqrt{2}} \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}.$$

After a long pause, she pointed to $\frac{\sqrt{2}}{2}$ and said, "I don't know how long that is. So I can't draw the square."

Mathematical Foci***Mathematical Focus 1***

A numerical approximation for $\frac{\sqrt{2}}{2}$ could be obtained using a calculator or by recalling that $\sqrt{2} \approx 1.414$. So, $\frac{\sqrt{2}}{2} \approx 0.707$.

Measuring approximating 0.707 units to create the square would be easy in some cases (e.g., if the length of a side of ABCD were 1 meter and the length of a side of the new square would be 707 millimeters).

Mathematical Focus 2

A segment of length, $\frac{\sqrt{2}}{2}$, could be found geometrically. The diagonals of a 1X1 square have length, $\sqrt{2}$. By bisecting a diagonal, we obtain a segment of length, $\frac{\sqrt{2}}{2}$. (See segment DQ in Figure 2.) Using segment DQ we may construct a square whose area is one-half that of square ABCD. (See DSTU in Figure 2.)

Figure 2.

Mathematical Focus 3

A segment of length $\frac{\sqrt{2}}{2}$ can be found using similar triangles.

The diagonals of a 1X1 square have length $\sqrt{2}$. By connecting the midpoints of segments AB and AD (points X and Y, respectively), we construct a pair of similar triangles, $\triangle ABD$ and $\triangle AXY$. See Figure 3. Because $\triangle ABD \sim \triangle AXY$ and

$$AX = AY = \frac{1}{2}, \quad XY = \frac{1}{2}BD = \frac{1}{2}\sqrt{2} = \frac{\sqrt{2}}{2}.$$

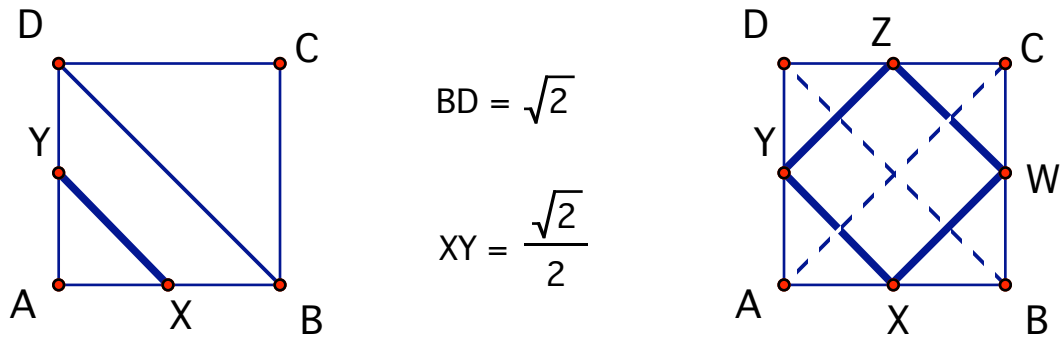

Figure 3.

By analogy, segments XW, WZ, and ZY have lengths $\frac{\sqrt{2}}{2}$. Since $\triangle XAY$, $\triangle XBW$, $\triangle W CZ$, and $\triangle ZDY$ are isosceles right triangles, the interior angles of YXWZ are

right angles. So, YXWZ is a square whose area, $\left(\frac{\sqrt{2}}{2}\right)^2 = \frac{1}{2}$, is one-half that of ABCD.

Mathematical Focus 4

An approximation of $\sqrt{2}$ can be found by using the square root algorithm:

$$\begin{array}{r}
 1. \quad 4 \quad 1 \quad 4 \dots \\
)2. \quad 00 \quad 00 \quad 00 \\
 \hline
 24 \quad 1 \quad 00 \\
 \quad \quad \quad 96 \\
 \hline
 281 \quad 4 \quad 00 \\
 \quad \quad \quad 2 \quad 81 \\
 \hline
 2824 \quad 1 \quad 19 \quad 00 \\
 \quad \quad \quad \quad 1 \quad 12 \quad 96 \\
 \hline
 \quad \quad \quad \quad \quad \quad 7 \quad 04
 \end{array}$$

So, $\frac{\sqrt{2}}{2} \approx 0.707$ is the length of the sides of the desired square.

Mathematical Focus 5

A numerical approximation for $\frac{\sqrt{2}}{2}$ can be found by using Newton's Method.

Newton's Method

$x_0 = \text{an initial guess}$

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}, \text{ where } n = 1, 2, 3, \dots$$

Because we want to approximate the dimensions of a square whose area is $\frac{1}{2}$ square units, we want to approximate the positive real root of $x^2 - \frac{1}{2} = 0$.

We use $f(x) = x^2 - \frac{1}{2}$ and $f'(x) = 2x$ to obtain $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - \frac{1}{2}}{2x_n}$

We know that our desired solution is between 0.5 and 0.75 (based on her work in Figure 1). These values are reasonable initial approximations. Figure 4 is a screen shot of ten successive approximations generated on Excel using the formulas shown in Figure 5.

n	x(n)	n	x(n)
0	0.5	0	0.75
1	0.75	1	0.70833333
2	0.70833333	2	0.70710784
3	0.70710784	3	0.70710678
4	0.70710678	4	0.70710678
5	0.70710678	5	0.70710678
6	0.70710678	6	0.70710678
7	0.70710678	7	0.70710678
8	0.70710678	8	0.70710678
9	0.70710678	9	0.70710678
10	0.70710678	10	0.70710678

Figure 4.

n	x(n)	n	x(n)
0	0.5	0	0.75
=A7+1	=B7-((B7)^2-0.5)/(2*B7)	=D7+1	=E7-((E7)^2-0.5)/(2*E7)
=A8+1	=B8-((B8)^2-0.5)/(2*B8)	=D8+1	=E8-((E8)^2-0.5)/(2*E8)
=A9+1	=B9-((B9)^2-0.5)/(2*B9)	=D9+1	=E9-((E9)^2-0.5)/(2*E9)
=A10+1	=B10-((B10)^2-0.5)/(2*B10)	=D10+1	=E10-((E10)^2-0.5)/(2*E10)
=A11+1	=B11-((B11)^2-0.5)/(2*B11)	=D11+1	=E11-((E11)^2-0.5)/(2*E11)
=A12+1	=B12-((B12)^2-0.5)/(2*B12)	=D12+1	=E12-((E12)^2-0.5)/(2*E12)
=A13+1	=B13-((B13)^2-0.5)/(2*B13)	=D13+1	=E13-((E13)^2-0.5)/(2*E13)
=A14+1	=B14-((B14)^2-0.5)/(2*B14)	=D14+1	=E14-((E14)^2-0.5)/(2*E14)
=A15+1	=B15-((B15)^2-0.5)/(2*B15)	=D15+1	=E15-((E15)^2-0.5)/(2*E15)
=A16+1	=B16-((B16)^2-0.5)/(2*B16)	=D16+1	=E16-((E16)^2-0.5)/(2*E16)

Figure 5.

There are other ways to generate these values. For example, we could use a TI-92 calculator in sequence mode to generate a table using

$$u1 = u1(n-1) - ((u1(n-1))^2 - 0.5) / (2 * u1(n-1))$$

$$u1 = .5$$

$$u2 = u2(n-1) - ((u2(n-1))^2 - 0.5) / (2 * u2(n-1))$$

$$u2 = .75$$

and

$$\text{tblStart} \quad 1$$

$$\Delta \text{tbl} \quad 1$$

Connection:

Students may find that The Math Forum's Dr. Math has a webpage devoted to finding square roots without a calculator. Dr. Math describes an algorithm in which the reader is instructed to follow a sequence of steps loosely described as:

1. Guess
2. Divide
3. Average

Continue steps 2 and 3 until the desired degree of accuracy is reached.

For example, to approximate the value of $\sqrt{2}$, we would do as follows:

1. Guess. Let us use 1.
2. Divide. Since we want to find $\sqrt{2}$, we would compute $2 \div 1 = 2$.

3. Average. For this step we compute the arithmetic average of 2 and 1.

$$\frac{2+1}{2} = 1.5$$

4. Divide. $2 \div 1.5 \approx 1.333$

5. Average. $\frac{1.5+1.333}{2} = 1.4165$

6. Divide. $2 \div 1.4165 \approx 1.4119$

7. Average. $\frac{1.4165+1.4119}{2} \approx 1.4142$

8. Divide. $2 \div 1.4142 \approx 1.4122$

9. Average. $\frac{1.4142+1.4122}{2} \approx 1.4132$

So, $\sqrt{2} \approx 1.41$ This process can be described symbolically as follows:

$$T(n+1) = \frac{\frac{2}{T(n)} + T(n)}{2}, \text{ where } T(0) = \text{initial guess}$$

The mathematical basis for this recursive algorithm is Newton's Method applied using $f(x) = x^2 - 2$ for which we are interested in finding an approximation for a positive root.

$$\begin{aligned} x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - 2}{2x_n} \\ &= \frac{2x_n^2 - (x_n^2 - 2)}{2x_n} = \frac{x_n^2 + 2}{2x_n} = \frac{x_n + \frac{2}{x_n}}{2} \end{aligned}$$
